

DMIP

Welcome to the ONF Device Management Interface Profile and Requirements project !

The ONF Device Management Interface Profile and Requirements (DMIP) project chartered under the ONF [Open Transport Configuration & Control \(OTCC\)](#) is responsible for the development of a technology agnostic unification of semantics and behavior on the interface between controller and device (see also orange arrows in the picture below).

Target of the Device Management Interface Profile and Requirements project is complementing the technology specific interface definitions for enabling any 3rd party to provide applications for managing a multi-vendor network.

The project uses the following mailing/discussion list: <https://groups.google.com/a/opennetworking.org/forum/#!/forum/device-management>
